Our digital specification sheet and certificate of analysis provides all the information you need about each and every compound in the mixes including the names, CAS#, concentration, molecular formula, molecular weight, retention times, spectra, methods, columns, SDS, etc.

We provide additional methods through the digital specification sheet, and we share our experience with you to achieve the best results through our strong support service.

The Library is focused on food and aroma analysis with 258 FEMA FLAVORS indexed molecules; however, most of the flavors and aromas that we developed a sense for, come from natural resources. 305 of the molecules included are indexed in HMDB as identified or quantified in human biofluids which are produced either endogenously or through consumption of food.
